

Wednesday 6 July, 17:05 – 17:30

Session 12: Charged-lepton flavour violation and other experimental searches

Physics potential of novel neutrino beams from pion and muon decay

S Boyd

University of Warwick, UK

The sensitivity of the next generation of long baseline experiments depends on achieving a challenging level of understanding of the systematic uncertainties in the prediction of the neutrino flux and interaction cross sections. New beamlines and facilities have been proposed to aid in the minimisation of these systematic uncertainties. This talk will review several proposals for novel pion and muon beamlines and facilities.
