P2.006 Search for signal emission from AGN populations with the ANTARES neutrino telescope

R G Ruiz

APC, France

on behalf of ANTARES collaboration

We use a two point correlation analysis to look for inhomogeneities in the arrival directions of the high energy muon neutrino candidates detected by the ANTARES neutrino telescope. This approach is complementary to a point source likelihood-based search, which is mainly sensitive to single point like sources and not to collective effects. We present the results of a search based on this two point correlation method performed on ANTARES 2007-2014 data, providing constraints on models of a population of Active Galactic Nuclei (AGN) too faint to be detected by the likelihood-based method.
